

case study

secure online backup

As one of the largest single-site landscaping companies in the Midlands, tlandscapes are specialists in their field, committed to delivering quality design and construction services to their customers.

With 25 years of experience tlandscapes know how important quality is to their customers, which is why they use only the best materials and practices, to ensure that all projects are finished to the highest possible standard. Their previous tape based backup methods proved unreliable, as a backup often failed and this process became an inconvenience as tapes required labelling and removing offsite each night.

As a result they required an online backup specialist, who would provide them with the quality and assurance that their data is being protected 24/7 with a quick recovery time, to ensure business continuity.

Datastore 365 have provided tlandscapes with data protection that is delivered through a disk to disk backup appliance, that stores a copy of the data locally and automatically encrypts, compresses and transmits data via the internet, to the Datastore 365 data centre. This means that all critical data can be restored within minutes not hours! Knowing that their data is protected gives tlandscapes peace of mind, which is essential to any business.

"I have been most impressed with the online backup and would recommend it to any small, medium or large business looking to upgrade from traditional tape backup systems of the past."
