case study
Datastore 365 Private Cloud

Fusion Care Solution have been designing software for the care industry for around 10 years. We have a complete care home management system to manage things like, electronic care plans, timesheets, rotas, staff training, Resident invoicing and much more.

When we first started selling our software we hosted the software ourselves on dedicated servers. This means we had to manage the Operating System, Software, backups, updates, server hardware and upgrades, internet usage and power consumption. With the datastore 365 cloud all of this is looked after by them in their fully redundant tier 4 datacentre. Management and provisioning of servers and services is simple and quick using VMware vCloud Director

We chose datastore for their dedicated approach to customer service, we get an exceptional and personalised service from the datastore team and their knowledge of their systems and the cloud sector means they can answer pretty much any question/ problem we throw at them. On top of that they are an ISO:27001 accredited company giving us the peace of mind that our customers data is secure.

Its piece of mind knowing your system is in safe hands. We don't need to worry about hardware failures or outages as they guarantee their uptime.

There fixed pricing structure means its easier for us to budget our own cashflow. There is no unexpected costs that would arise from hosting the systems ourselves, e.g. hardware failures or internet outages.
